# The AI Spoon

En explanatory model for use in teaching AI ethics

AI in general refers to algorithms that re-calibrate themselves according to a pre-defined machine-learning system. They sound intelligent, but they still only focus on completing the specific task they are programmed to do, under a narrow set of constraints and limitations.

This diagram can be used to talk about actions of intervention and oversight within the context of algorithms left to their own devices. Issues of transparency and the liability of stakeholders should be further discussed.
